EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it MUST be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with Mr. Kurt Grossman on 1/8/07.

The application has been amended as follows:

[Claim] 1. A catheter introducer assembly, comprising:

a) a needle assembly comprising a needle having a diameter, a proximal end, attached to a needle hub, a distal end extending therefrom, said the distal end including a sharp tip with a bevel, and a longitudinal axis therebetween, said needle further including a bent area disposed between said proximal and distal ends such that a portion of said needle distal of said bent area extends along a path other than said longitudinal axis and no portion of said bevel is in said bent area, said bevel extending at an angle relative to said longitudinal axis;

b) a catheter assembly comprising a tubular catheter having a proximal end attached to a catheter hub, and a distal end, said introducer needle being coaxially received within said catheter;

c) a needle tip protector disposed within said catheter hub, said needle tip protector is slidably disposed onto said needle, whereby when said needle is proximally removed from said catheter said protector remains attached to said needle.

Art Unit: 3763

[Claim] 14. The catheter introducer assembly of claim 1, said path of said needle portion distal of said bent area being offset from, but generally parallel to, said longitudinal axis.

2. The following is an examiner's statement of reasons for allowance: The subject matter of the independent claims could not be found and was not suggested by the prior art of record. The subject matter found is the needle having a bent area that extends along a path other than the longitudinal axis of the needle and having no portion of the bevel in the bent area in combination with the other features of the invention substantially as claimed. Also not found is the needle having a bent area disposed between the proximal and distal ends such that a longitudinal axis of the distal end of the needle is offset from, but generally parallel to, the longitudinal axis of the proximal end of the needle in combination with the other features of the invention substantially as claimed.

3. The closest prior art of record is Woehr et al (US 6287278). Woehr discloses a similar invention, however lacks the bend in the needle as specified by the independent claims of the current application.

Any comments considered necessary by applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue fee. Such submissions should be clearly labeled "Comments on Statement of Reasons for Allowance."

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Laura A. Bouchelle whose telephone number is 571-272-2125. The examiner can normally be reached on Monday-Friday 8-4.
